

SNAPTRACKER OVERVIEW

OVERVIEW

SnapTracker is multi-functional computer database system designed by a furniture dealer expressly for the management of furniture assets. Using bar code technology, **SnapTracker** will not only let you know what furniture you have available, but can tell you colors, fabrics, condition of individual items, quantities, storage location of products, and that's just the beginning. **SnapTracker** is extremely flexible and can be adapted to fit your specialized needs, particularly in regard to system input and reporting options.

HOW IT WORKS

A large compilation of information is electronically captured about each asset in your inventory of furniture, and is expressed through a collection of standard reports. All data is reported using industry-standard terminology and codes, allowing the information to be useful in a variety of applications. We maintain a large collection of reports, which display the information you're interested in viewing about your usable assets, and in addition, we have the ability to customize reports for your particular situation.

BENEFITS

SnapTracker saves you time and money... A key feature of the best warehousing services we offer is that all furniture is disassembled and stored as component parts. In combination with the comprehensive database SnapTracker provides, you have the capability to "mix and match" within your inventory. For example, a new end panel or painting one pedestal might be all that is required to reconfigure a complete workstation.
